

# Network

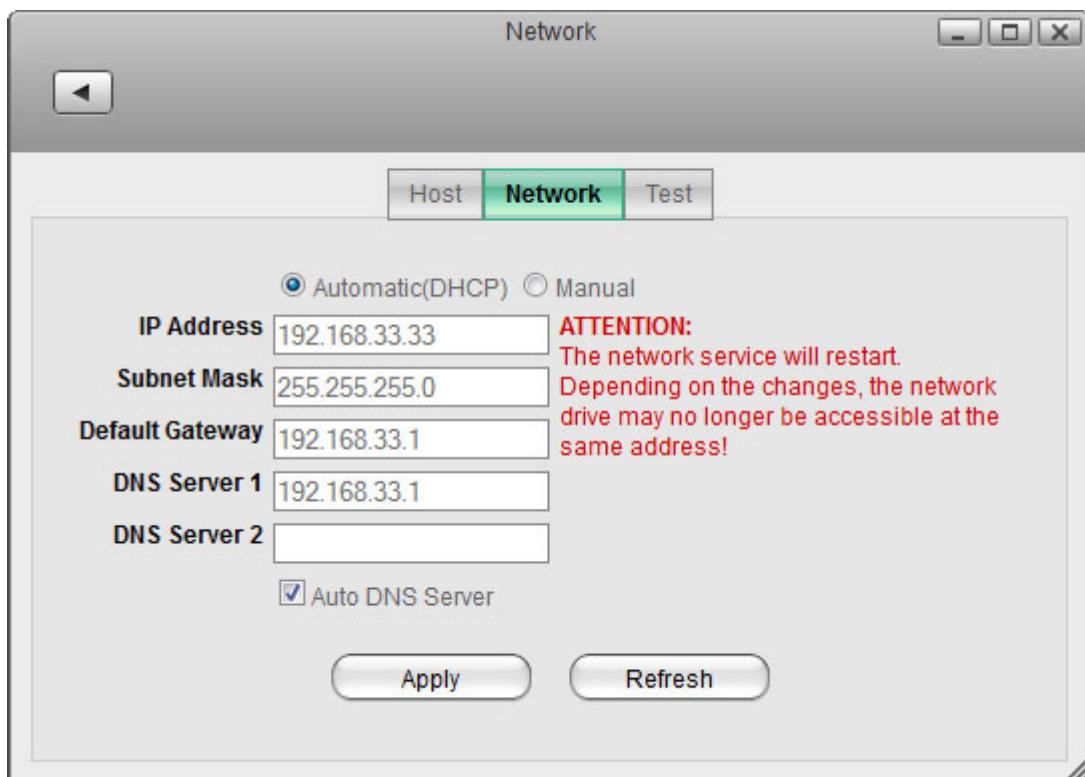

Configure the network settings of your network drive.

## Host

Field	Description
<b>Host Name</b>	Define the host name of your network drive. Make sure to use a unique name and not one that has already been used on your network.
<b>Apply</b>	Apply and save the changes.

## Network

Field	Description
<b>Automatic (DHCP)</b>	Automatically obtain an IP address for your network drive from the local DHCP server or network router.
<b>Manual</b>	Configure the settings manually. If you are not sure what to fill out, enable <b>Automatic(DHCP)</b> or ask your system administrator.
<b>IP Address</b>	The local IP address of your network drive.
<b>Subnet Mask</b>	The subnet mask of your local network. Usually, the subnet mask is set to 255.255.255.0.
<b>Default Gateway</b>	The default gateway of your local network. Usually, this is the IP address of your network router.
<b>DNS Server 1/2</b>	The IP address of the DNS servers you want to use. Usually, this is the IP address that is recommended by your ISP (internet service provider) but you can also use another DNS server. As an example, Google provides a free DNS service at 8.8.8.8 and 8.8.4.4.
<b>Auto DNS Server</b>	Enable this option to automatically obtain an IP address for the DNS server.
<b>Apply</b>	Apply and save the changes.

Changing the network settings can affect the running network services and the users that are currently connected to the device. Also, if you change the IP address, remember to adjust your other settings like port forwarding on your network router or any mapped folders that are still using the old IP address.

## Test

These tools can be used to troubleshoot network problems. If you have network problems and contact

support, you might be asked to run some of these tests and send the results back for further troubleshooting.

Network

Host Network **Test**

Ping  [Check](#)

Traceroute  [Check](#)

Field	Description
<b>Ping</b>	Enter an IP address and click <b>Check</b> to ping the remote address in order to see if it can be reached.
<b>Traceroute</b>	Enter an IP address and click <b>Check</b> to trace the route from your network drive to the remote address.
